

Using the Mobile App: Offline Files and Camera Backup

article_id: kb-mobile-004 | product_area: mobile | last_updated: 2026-04-22

Using the Mobile App: Offline Files and Camera Backup

Overview

The Nimbus mobile app enables users to access files on the go, work offline, and automatically back up photos and videos. This article equips support agents with a thorough understanding of offline file handling, camera backup configuration, common pitfalls, and escalation procedures. It cross-references related knowledge-base articles such as **File Sync Issues**, **Notification Settings**, and **Error Code Reference**.

Core Features

- **Offline file availability** - mark files to be stored locally for access without connectivity.
- **Automatic camera backup** - continuously upload new media to a dedicated folder.
- **Selective sync** - choose which folders are kept on the device to manage storage.
- **Push notifications** - receive real-time alerts for comments, shares, and mentions.

Common Customer Symptoms

- Files marked offline do not appear when the device is offline.
- Camera backup stops after switching to cellular data.
- The app consumes excessive storage on the device.
- Push notifications are not received on the mobile device.
- Sync errors appear after a large batch of offline files is added.

Root Causes

Symptom	Typical Cause
Offline files missing	Incomplete download, low storage, or background sync disabled
Camera backup pauses	Wi-Fi-only setting, battery-optimization killing background service
High storage usage	Large number of offline files or cached thumbnails
Missing push notifications	OS-level notification permission disabled, app restricted in background

Sync errors after offline addition	Queue overload, network interruption during batch download
------------------------------------	--

Detailed Troubleshooting Steps

• Verify Offline Availability

- Open the file, tap the "...\" menu, and ensure **"Available offline"** is toggled on.
- Check **Settings -> Offline Files -> Storage Limit**; increase if the device is low on space.

• Force a Sync Refresh

- Pull down on the main file list to trigger a manual sync.
- If files still do not appear, toggle **"Available offline"** off and on again.

• Inspect Camera Backup Settings

- Settings -> Camera Backup -> ensure **"Upload over Wi-Fi only"** is set according to user preference.
- For cellular uploads, enable **"Use cellular data"** but warn about data consumption.

• Check Battery-Optimization Settings

- Android: Settings -> Battery -> Battery optimization -> exclude **Nimbus**.
- iOS: Settings -> Nimbus -> Background App Refresh -> ON.

• Clear App Cache

- Settings -> Storage -> Clear Cache to free space and remove stale thumbnails.

• Review Sync Queue

- Open the tray icon -> **Sync Queue**; if the queue is > 50 items, pause and resume sync.

• Examine Error Codes

- Look for NB-SYNC-101 or NB-UP-317 in the mobile logs (Settings -> Help -> Show Logs).

• Validate Push Notification Permissions

- iOS: Settings -> Notifications -> Nimbus -> Allow Notifications.
- Android: Settings -> Apps -> Nimbus -> Notifications -> Enable.

Troubleshooting Tables

Offline File Errors

Error Code	Meaning	Common Cause	Recommended Resolution
MOB-OFF-101	Offline file not downloaded	Insufficient storage or background sync disabled	Free space, enable background sync in Settings -> Offline Files

MOB-OFF-204	Offline file corrupted	Interrupted download	Remove offline flag, re-enable to re-download
-------------	------------------------	----------------------	---

Camera Backup Issues

Error Code	Meaning	Common Cause	Recommended Resolution
CAM-101	Backup paused (Wi-Fi only)	Wi-Fi unavailable	Enable " Use cellular data " or connect to Wi-Fi
CAM-202	Battery optimization stopped backup	OS killed background task	Exclude Nimbus from battery optimization (see step 4)

Examples and Edge Cases

- **Case A:** User reports offline files not appearing after a weekend trip. Investigation shows the device ran out of storage; after increasing the offline storage limit and clearing cache, files synced correctly.
- **Case B:** Camera backup halted after a system update. The update reset background app refresh; re-enabling it restored backup.
- **Case C:** A user enabled offline for a 5 GB folder, causing the app to crash. Advise using selective sync to limit offline files to essential documents.

Frequently Asked Questions (FAQs)

- **Why does my offline file not download automatically?** The app only downloads when on Wi-Fi and background sync is enabled. Ensure those settings are on.
- **Can I limit how much storage the mobile app uses?** Yes, adjust the **Offline Files -> Storage Limit** slider in Settings.
- **How do I stop the app from using cellular data for camera backup?** Disable "**Use cellular data**" in Settings -> Camera Backup.
- **Why are push notifications missing on my phone?** Check OS notification permissions and background app refresh settings.
- **When should I escalate a mobile-app issue?** Escalate if offline files remain unavailable after clearing cache and re-enabling sync, or if camera backup fails repeatedly despite correct settings.

Escalation Guidance

- **Trigger 1:** Offline files remain missing after three sync attempts and cache clear.
- **Trigger 2:** Camera backup repeatedly fails with CAM-202 despite disabling battery optimization.
- **Trigger 3:** Push notification failures on multiple devices for the same user.
- **Trigger 4:** App crashes when enabling large offline folders.

Create a **Mobile App Escalation Ticket** containing:

- User ID and device model.
- List of error codes observed.
- Steps taken and outcomes.
- Relevant log excerpts (Settings -> Help -> Show Logs).

Cross-Article References

- See **File Sync Issues** for deeper sync error analysis.
- Refer to **Notification and Alert Settings** for push notification troubleshooting.
- Consult **Error Code Reference** for detailed error meanings.

Support Notes (Internal)

- Known issue: On Android 12, the app may delay offline downloads when the device is in Doze mode. Recommend adding Nimbus to the **Battery optimization whitelist**.
- For iOS, advise users to enable "**Low Data Mode**" off if they experience slow sync.
- Log all escalation tickets with sync queue snapshots for future performance analysis.
